Week 3

While loops, Structs, Enums, Variable Names

Micole Luons

Before we begin

Help Sessions

Lab check-ins

While Loops

Hand execute

```
#include <stdio.h>
int main(void) {
    int count = 100;
    while (count < 500) {
        printf("%d\n", count);
        count += 100;
    return 0;
```

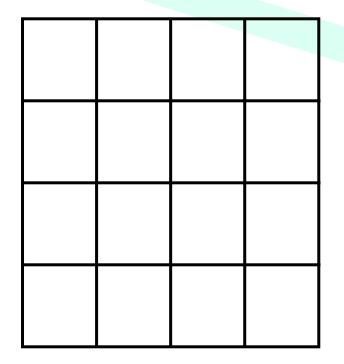

While loops

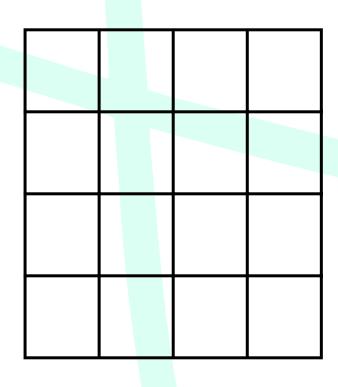

Hand execute these loops

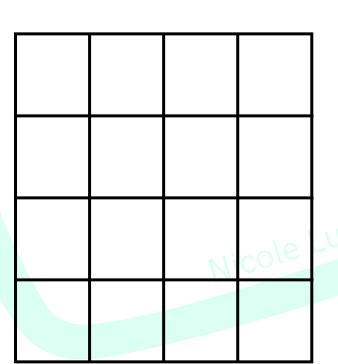

```
E
                                        3
Α
                                                                                  void c(void) {
                                                                                                                          void g(void) {
                                         void e() {
 void a(void) {
                                                                                      int i = 0;
                                                                                                                              int i = 0;
     int i = 5;
                                             int i = 0;
                                                                                      while (i < 32) {
                                                                                                                              int max = 32;
     while (i > 0) {
                                             int keep_going = 1;
                                                                                          printf("%d\n", i);
                                                                                                                              while (i < max) {
         printf("%d\n", i);
                                             while (keep_going == 1) {
                                                                                          i = i + 2;
                                                                                                                                  printf("%d\n", i);
        i--;
                                                 if (i > 3) {
                                                                                                                                  max = max + 2;
                                                     keep_going = 0;
                                                 i++;
                                             printf("%d\n", i);
                                                                                 G
                                                                                                                          H
                                                                                  void d(void) {
                                                                                                                          void h() {
                                                                                      int i = 5;
                                        D
                                                                                                                              int i = 0;
C
                                                                                      while (i >= 0) {
                                                                                                                              int keep_going = 0;
                                         void f(void) {
 void b(void) {
                                                                                          printf("%d\n", i);
                                                                                                                              while (keep going == 1) {
                                             int i;
     int i = 1;
                                                                                          i--;
                                                                                                                                  if (i > 3) {
                                             while (i > 0) {
     while (i < 32) {
                                                                                                                                      keep going = 0;
                                                 printf("%d\n", i);
         printf("%d\n", i);
                                                 i--;
        i = i + i;
                                                                                                                                  i++;
                                                                                                                               printf("%d\n", i);
```

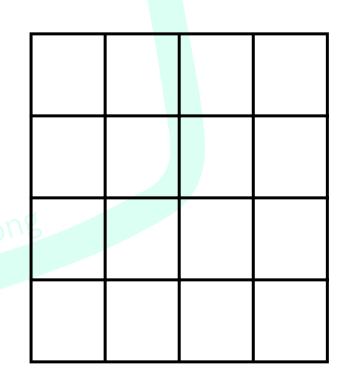

2D While loops

Draw these 4 grids and fill out the patterns printed out by these loops

```
void a(void) {
    int row = 0;
    while (row < SIZE) {
        int col = 0;
        while (col < SIZE) {
            if (row == col) {
                printf("0");
            } else {
                printf("X");
            }
            col++;
        }
        row++;
        printf("\n");
      }
}</pre>
```

```
void c(void) {
   int row = 0;
   while (row < SIZE) {
      int col = 0;
      while (col < SIZE) {
        if (col != 1 && row != 1) {
            printf("0");
      } else {
            printf("X");
      }
      col++;
    }
    row++;
    printf("\n");
}</pre>
```

```
void b(void) {
   int row = 0;
   while (row < SIZE) {
      int col = 0;
      while (col < SIZE) {
        if (col % 2 == 0) {
            printf("0");
        } else {
            printf("X");
      }
      col++;
    }
    row++;
    printf("\n");
   }
}</pre>
```

```
void d(void) {
    int row = 0;
    while (row < SIZE) {
        printf("X");
        int col = 1;
        while (col < 3) {
            if (row == 0 || row == 3) {
                 printf("X");
            } else {
                 printf("0");
            }
            col++;
        }
        printf("X");
        row++;
        printf("\n");
    }
}</pre>
```

Structs

User defined datatype that allows users to group together items of different types

Instead of this:

int rex_age

5

char rex_gender

M

double rex_weight
15.3

Do this:
struct dog {
 int age;
 char gender;
 double weight;

int age
5
char gender
M
double weight
15.3

Why?

- Store related information in a single datatype rather than multiple
- Can return more information from functions

Enums

Instead of this:

Micole Luong

};

User defined datatype that allows users to assign names to predefined constants

```
#define MONDAY 0
#define TUESDAY 1
#define WEDNESDAY 2
#define THURSDAY 3
#define FRIDAY 4
#define SATURDAY 5
```

#define SUNDAY 6

```
Do this:
enum weekdays {
  MONDAY,
  TUESDAY,
  WEDNESDAY,
  THURSDAY,
  FRIDAY,
  SATURDAY,
  SUNDAY
```

Why?

- The type
 conveys more
 information to
 the user
 eg. int vs
 enum
 weekdays
- Assigns the constants for you

Variable Names

Legal Variable Names in C

- Contains letters, numbers, or _
- Must not start with a number

Good Style

- Start with lowercase
- Snake case eg. good_example_variable_name
- #defines names and enums must be in SHOUTING_SNAKE_CASE
- Descriptive and relevant to the program
